Probing the TeV scale and beyond with EDMs

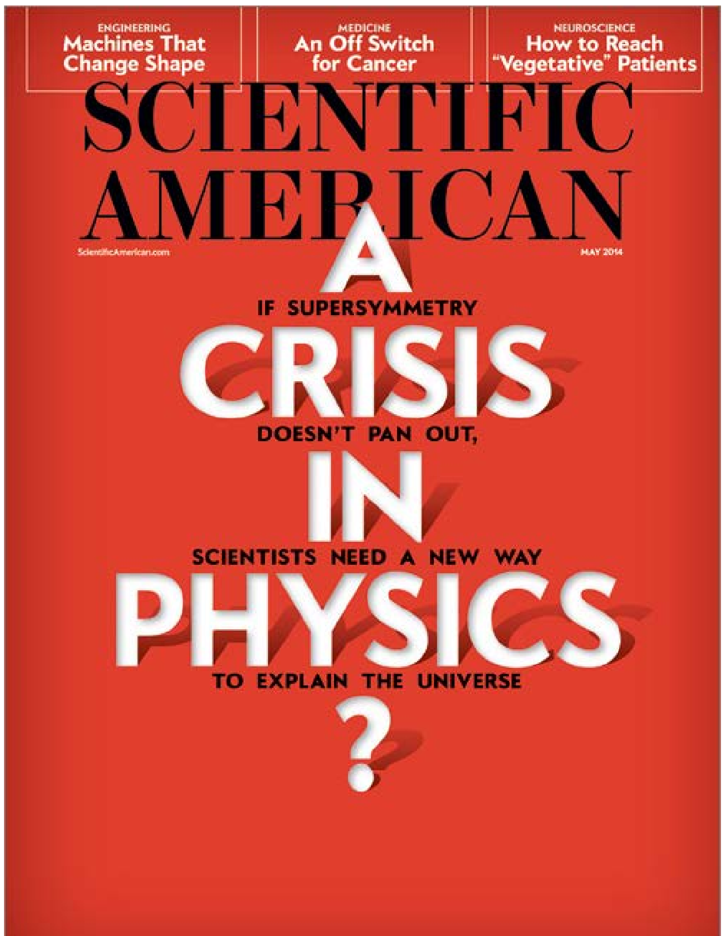
Junji Hisano (KMI, Nagoya Univ.)

10^{th} International Workshop on Fundamental Physics Using Atoms (FPUA)

Contents

Big issue in particle physics now

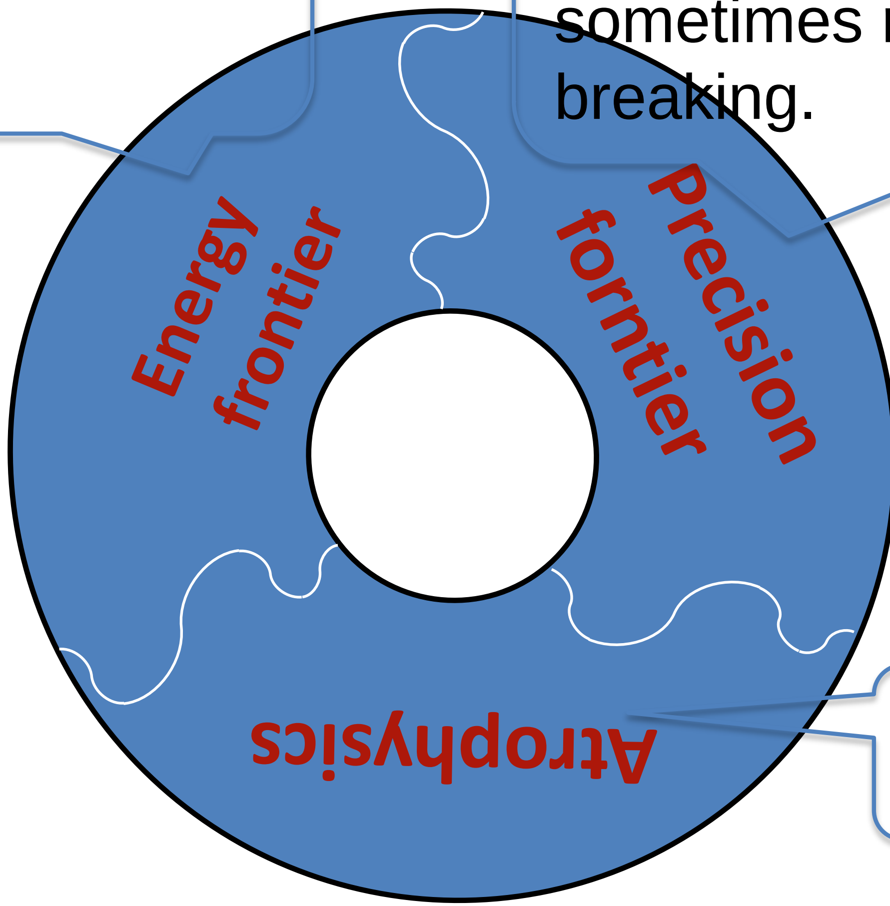
Where is BSM ? TeV scale or higher energy scale?



Tools to search for new physics

Direct search for TeV-scale physics
- LHC
- ILC

- High statistical experiment
- High precise theoretical prediction, sometimes related to symmetry breaking.



- Underground exp.
- Cosmology

EDMs

Magnetic and electric dipole moments (MDM and EDM) with spin **S**

$$H = -\mu\,\mathbf{B}\cdot\frac{\mathbf{S}}{S} - d\,\mathbf{E}\cdot\frac{\mathbf{S}}{S}$$

Under time(T) and space(P) reflections, EDM is T, P-odd.

$$P:\mathbf{E}\to-\mathbf{E},\ \mathbf{B}\to+\mathbf{B},\ \mathbf{S}\to+\mathbf{S}$$
$$T:\mathbf{E}\to+\mathbf{E},\ \mathbf{B}\to-\mathbf{B},\ \mathbf{S}\to-\mathbf{S}$$

EDMs are sensitive to CP violation under CPT inv.

EDMs are good probes to CP violation in particle physics models.

EDMs sensitive to TeV-scale and beyond

Current upper bounds on electron and neutron EDMs:

$|d_e| < 8.7 \times 10^{-29}$ e cm (ACME, 13) $|d_n| < 2.9 \times 10^{-26}$ e cm (Baker et al, 06)

Dim. analysis for EDM:

$$d_e \sim e\frac{m_e}{M^2} = 10^{-23} e\mathrm{cm}\left(\frac{1\mathrm{TeV}}{M}\right)^2$$

$$d_d \sim e\frac{m_d}{M^2} = 10^{-22} e\mathrm{cm}\left(\frac{1\mathrm{TeV}}{M}\right)^2$$

(Renormalizable models give extra suppressions to EDMs by loop factors (~$O(10^{-(2\text{-}4)})$).)

Searches for symmetry breaking

Global symmetries in SM are not exact in nature.

- **CP violation (CKM in the SM)**

  EDMs

- **Lepton-flavor violation（neutrino oscillation）**

  Charged lepton flavor-violating decay

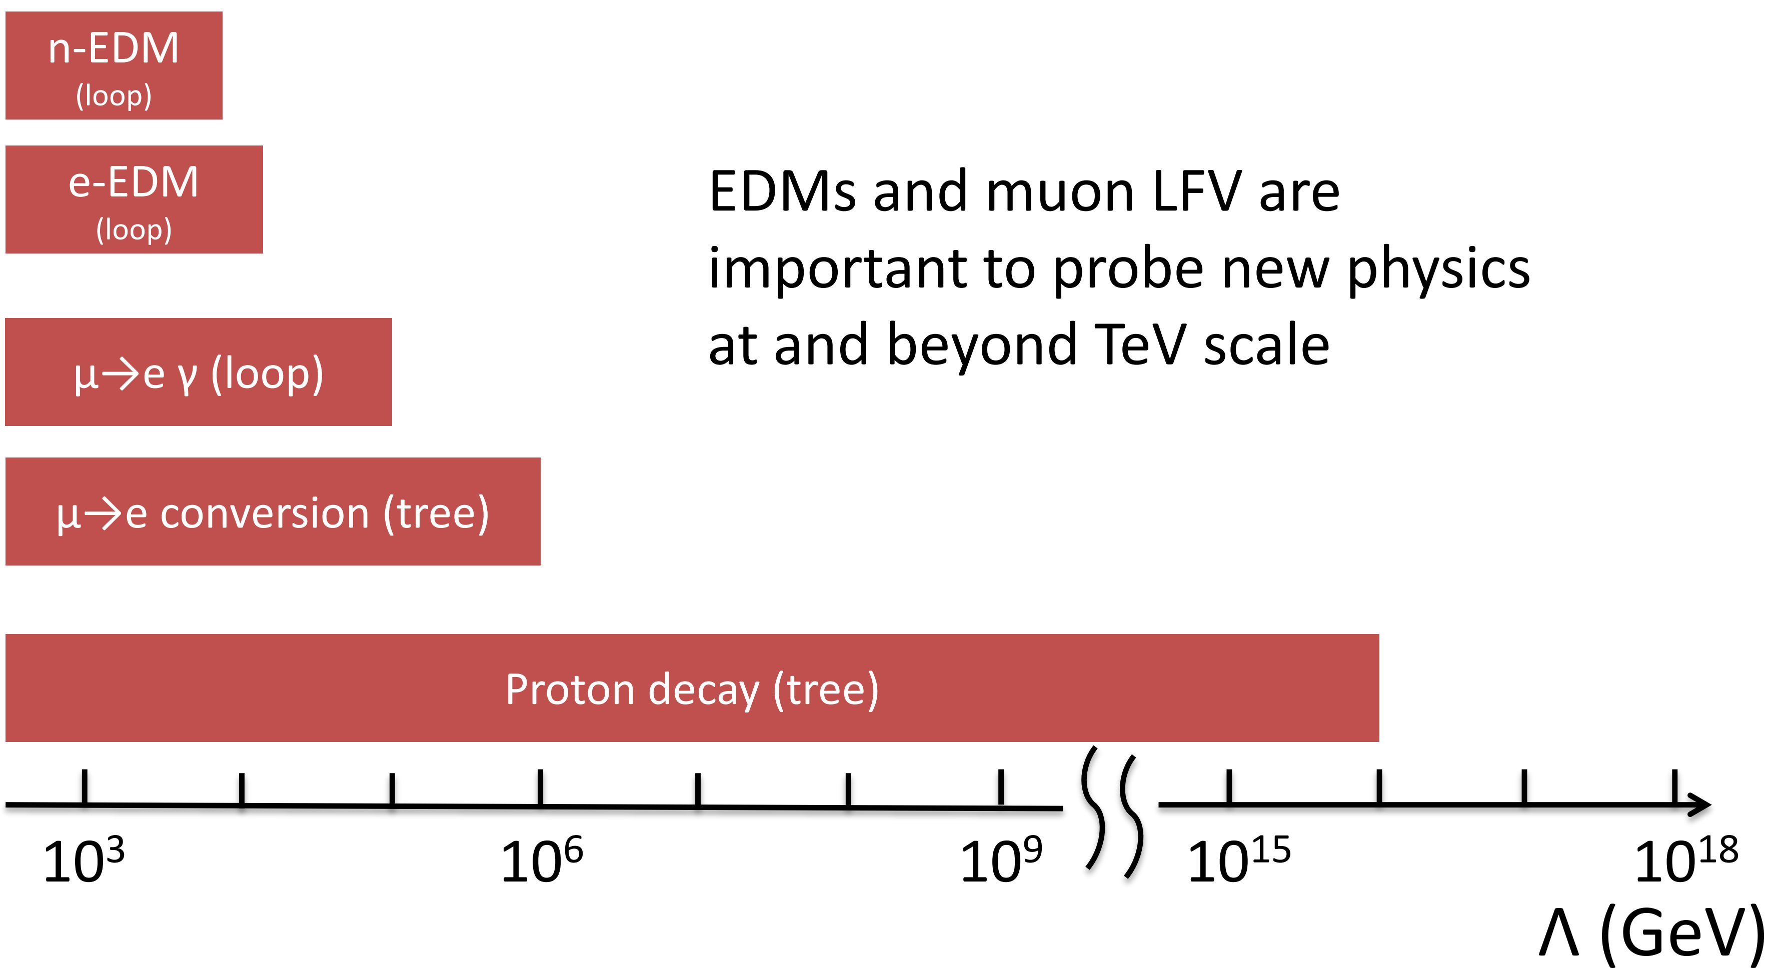
- **Lepton and/or baryon number violation (Baryon asymmetry in the universe)**

  $0\nu\beta\beta$decay

  Proton decay

Searches for symmetry breaking

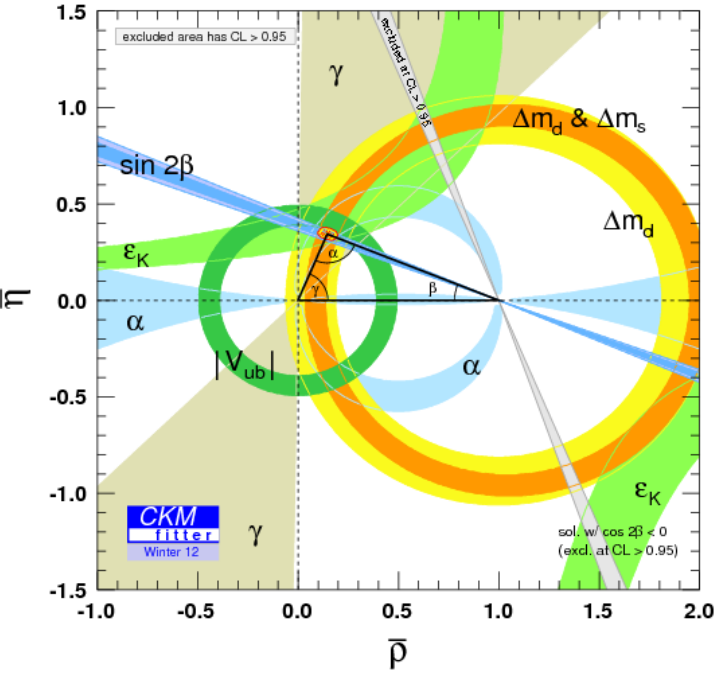
Sensitivities of current experimental bounds on new physics scale (Λ).
Only one loop factors are included for the loop processes.
Small symmetry breaking parameters suppress the sensitivities.



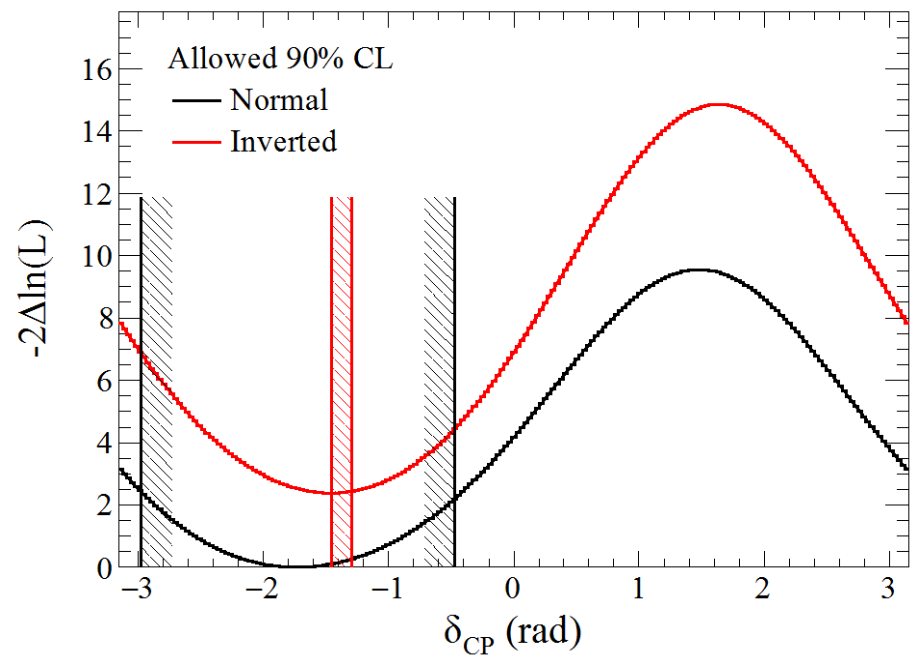
EDMs and muon LFV are important to probe new physics at and beyond TeV scale

CP phases are naturally O(1) ?

CKM



PMNS



EDM measurements

Schiff's theorem:

EDM for neutral syst. which composes of non-rel. point particles is zero.

Neutral particle EDMs:

- paramagnetic atoms (Tl, Fr..) /molecules (YbF, ThO, PbO..)

  Sensitive to electron EDM.

  $|d_e|<8.7\times10^{-29}$ e cm (ThO,2013) , 1.3×10^{-28} e cm (HfF^+,2017)

  Future prospects: $|d_e|\sim10^{-30}$ e cm
- diamagnetic atoms (Sensitive to T, P-odd nuclear force)

  $|d_{Hg}|<3.1\times10^{-29}$ e cm, $|d_{Xe}|<6.6\times10^{-27}$ e cm
- neutron

  $|d_n|<3.0\times10^{-26}$ e cm (revised analysis, 2015)

  UCN experiments aim to $|d_n|\sim10^{-(27-28)}$ e cm.

(Flavor-conserving) CP-violating interactions at parton level up to D=6

$$-\mathcal{L} = \frac{g_s^2\bar{\theta}}{32\pi^2}G\tilde{G} + \sum_{f=u,d,s,e} d_f \frac{i}{2}\bar{f}(\sigma\cdot F)\gamma_5 f + \sum_{q=u,d,s} d_f^c \frac{i}{2}\bar{q}(\sigma\cdot G)\gamma_5 q$$

QCD theta term

Quark and lepton EDMs

Quark CEDMs

$$+\frac{1}{3}wGG\tilde{G} + \sum_{f,f'=u,d,s,e}(\bar{f}f)(\bar{f}\gamma_5 f)$$

Weinberg op.

4-Fermi

- Wilson coefficients for CP-violating operators depend on CP phases in particle physics models.

(Flavor-conserving) CP-violating interactions at parton level

$$-\mathcal{L} = \frac{g_s^2 \bar{\theta}}{32\pi^2} G\tilde{G} + \sum_{f=u,d,s,e} d_f \frac{i}{2} \bar{f}(\sigma \cdot F)\gamma_5 f + \sum_{q=u,d,s} d_f^c \frac{i}{2} \bar{q}(\sigma \cdot G)\gamma_5 q$$

QCD EDM CEDM

Strong-CP problem: $d_n \sim e\bar{\theta} \times 10^{-(16-17)} e\mathrm{cm}$

The most promising solution is Peccei-Quinn mechanism.

$$\bar{\theta} = \langle S \rangle \simeq 0 \quad (S : \mathrm{axion})$$

Other proposal: spontaneous CPV, ~~vanishing quark~~ mass.

Evaluation of EDMs

Leptonic EDM

$d_e, \ d_\mu$

Four-fermi operators

CP violation in QCD

(From the report of the "Flavour in the era of the LHC" Workshop, 88')

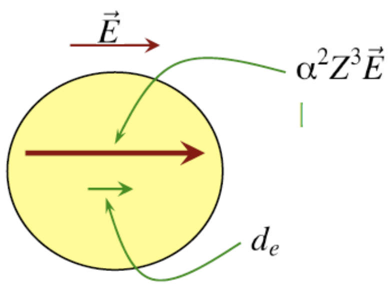
Evaluation of EDMs

Leptonic EDM

$d_e, \ d_\mu$

EDMs for paramagnetic atoms/molecules sensitive to electron EDM

- For high Z atoms, an enhance factor for internal E field is ~ $\alpha^2 Z^3$.
- Polar molecules, such as ThO, have larger enhancement factors.



- 4F operators (eeqq) also contribute to them.

Evaluation of EDMs

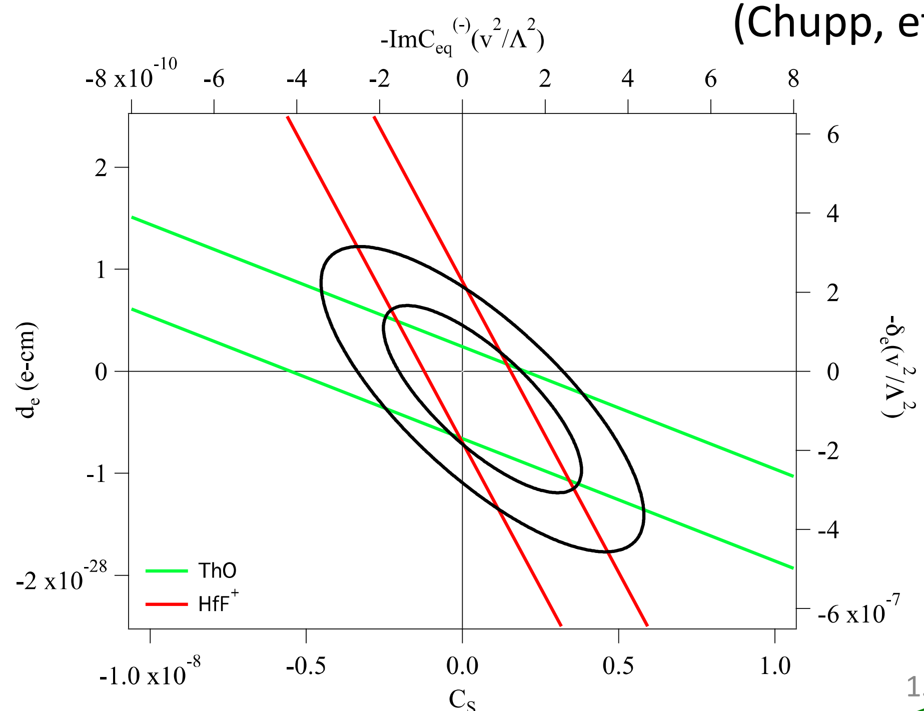
Leptonic EDM

$d_e,\ d_\mu$

EDMs for paramagnetic atoms/molecules sensitive to electron EDM

ThO and HfF^+ EDM constraints

(Chupp, et a)



Evaluation of EDMs

Neutron EDM

QCD sum rules (our)

$$d_n = 1^{+0.8}_{-0.4}(-0.2d_u + 0.8d_d + e(0.3d_u^c + 0.6d_d^c))$$

(JH, Lee, Nagata, Shimizu,
and also JH, Nagata, Fuyuto)

Lattice QCD result at physical point

$$d_n = -0.233(28)d_u + 0.774(66)d_d$$

(Bhattachrya et al , 1506.04196)

Theta and CEDM contributions to neutron EDM are evaluated with lattice QCD.
(Oki-san's talk)

CP violation in QCD

c

(From the report of the "Flavour in the era of the LHC" Workshop, 88')

Steps to diamagnetic atoms

1. CP-odd πNN coupling
   QCD sum rules evaluation has O(1) uncertainties.
2. (T,P-odd) nuclear Schiff moment
   O(1) uncertainties.
3. Atomic EDM (almost converged)

Roughly speaking,

$$d_{Hg} \sim 10^{-3}\, d_q^c \quad (q=u,d)$$

Then, the constraints on CEDMs are comparable to neutron EDM.

of EDMs

CP violation in QCD

perators

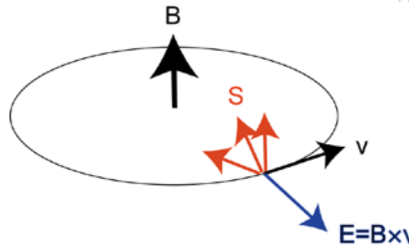
c

(From the report of the "Flavour in the era of the LHC" Workshop, 88')

New type of EDM measurements

Charged particles in storage rings (new methods):

Strong motional E field for relativistic particles in B field.
Measure of tilt of spin precession plane in E field.



- proton/deuteron

  prospects: $d_p \sim 10^{-29}$ ecm, $d_D \sim 10^{-29}$ ecm.

  Anatomic study of hadronic EDMs would be possible.

  $$d_D=(d_p+d_n)+d_D^{NN\pi}$$

- muon

  Prospects: $d_\mu \sim 10^{-21}$ ecm (ultimate case, 10^{-24} ecm)

  flavor-blind case: $d_\mu=(m_\mu/m_e)d_e<2\ 10^{-26}$ ecm

  Larger value might be possible in flavor-violating cases.

SM prediction

In the SM, origin of CP violation is a phase in Kobayashi-Maskawa matrix (except for QCD theta term). CPV obs. are prpto to Jarlskog (rephasing) invariant:

$$J_{\rm CP} = {\rm Im} V_{cs}^{\star} V_{us} V_{cd} V_{ud}^{\star} \sim 10^{-5}$$

- Quark EDMs

  $d_d \sim 10^{-34}$ e cm (3loops at $O(G_F^2\,\alpha_s)$)

- Neutron EDM

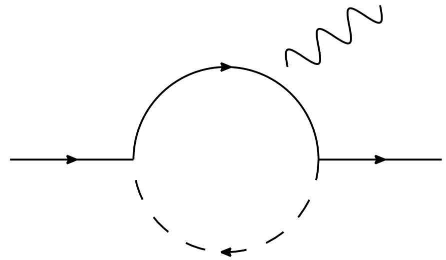
  $d_n \sim 10^{-(31\text{-}32)}$ e cm (long-distance effect at $O(G_F^2)$)

- Electron EDM

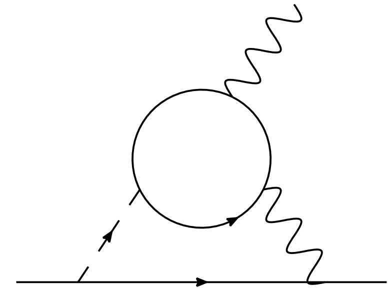
  $d_e \sim 10^{-40}$ e cm (4loops $O(G_F^3\,\alpha_s)$)

Discovery of non-zero EDM means beyond the SM.

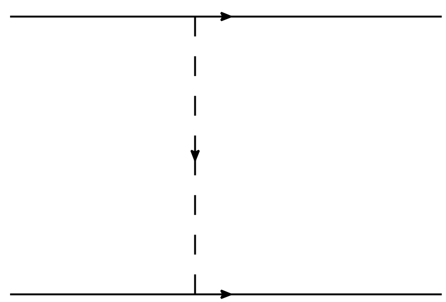
EDMs from BSM



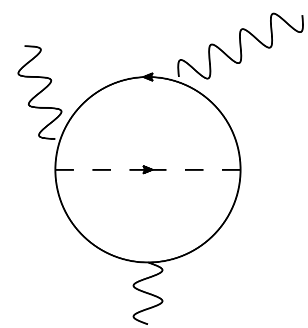
Quark/lepton (C)EDMs



Quark/lepton (C)EDMs
(Barr-Zee diagram)



Four-Fermi op.



Weinberg op.

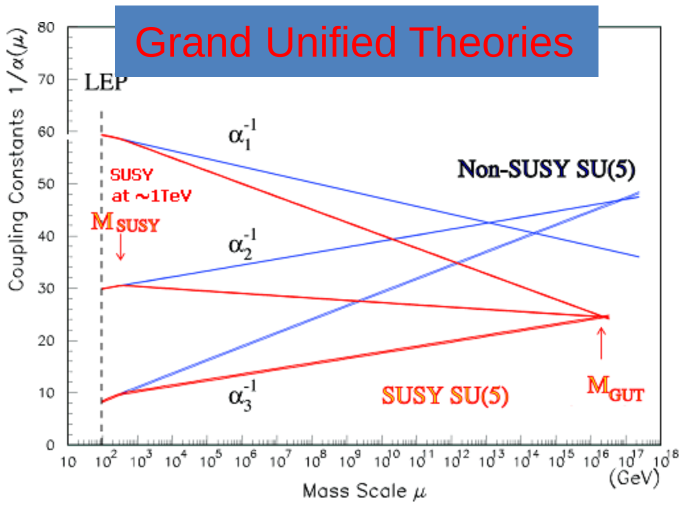
Assuming maximal CP phases, one-loop diagrams for (C) EDMs give strong constraint to new-physics above the TeV scale, and even two-loop diagrams can also constrain new physics around TeV scale.

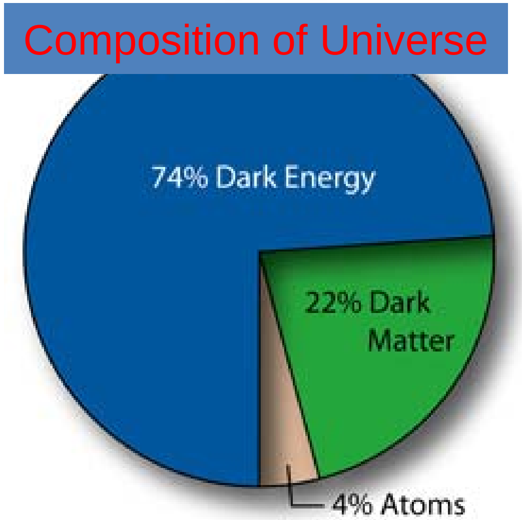
Supersymmetric Standard Model

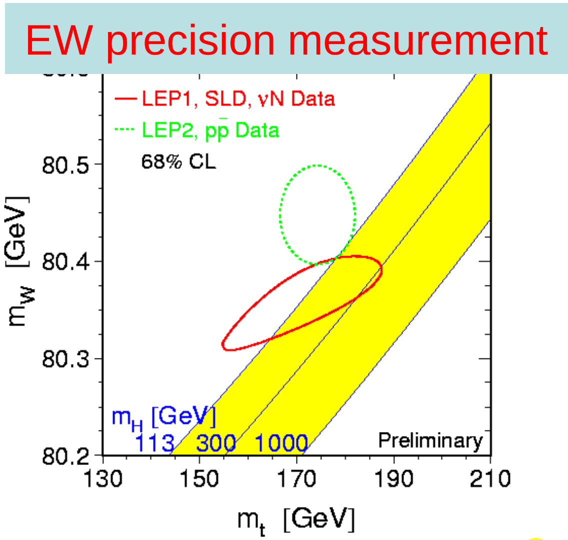
Boson ⇄ Fermion

Most promising model of beyond the standard model

- Hierarchy problem $(M_Z \ll M_{\rm Planck})$
- Gauge coupling unification $(M_{\rm GUT} \simeq 10^{16}{\rm GeV})$
- Dark matter in Universe $(\Omega_{\rm DM} \simeq 22\%)$
- Light Higgs mass $(m_{h^0} \lesssim 130 - 140{\rm GeV})$



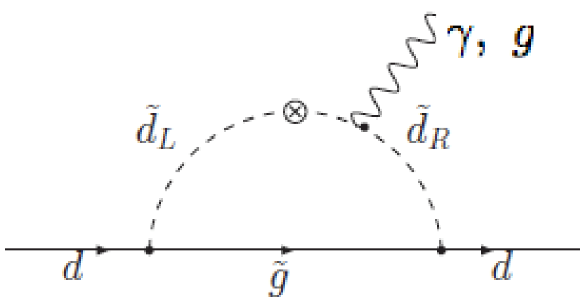


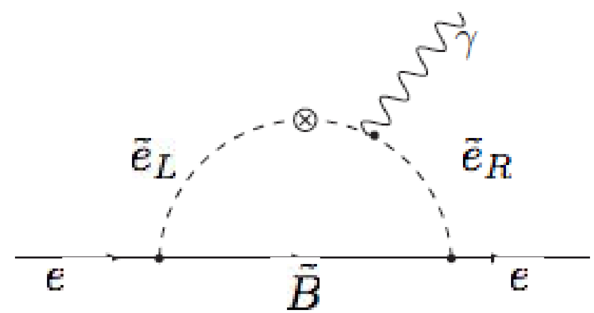


CP phases in the supersymmetric standard model

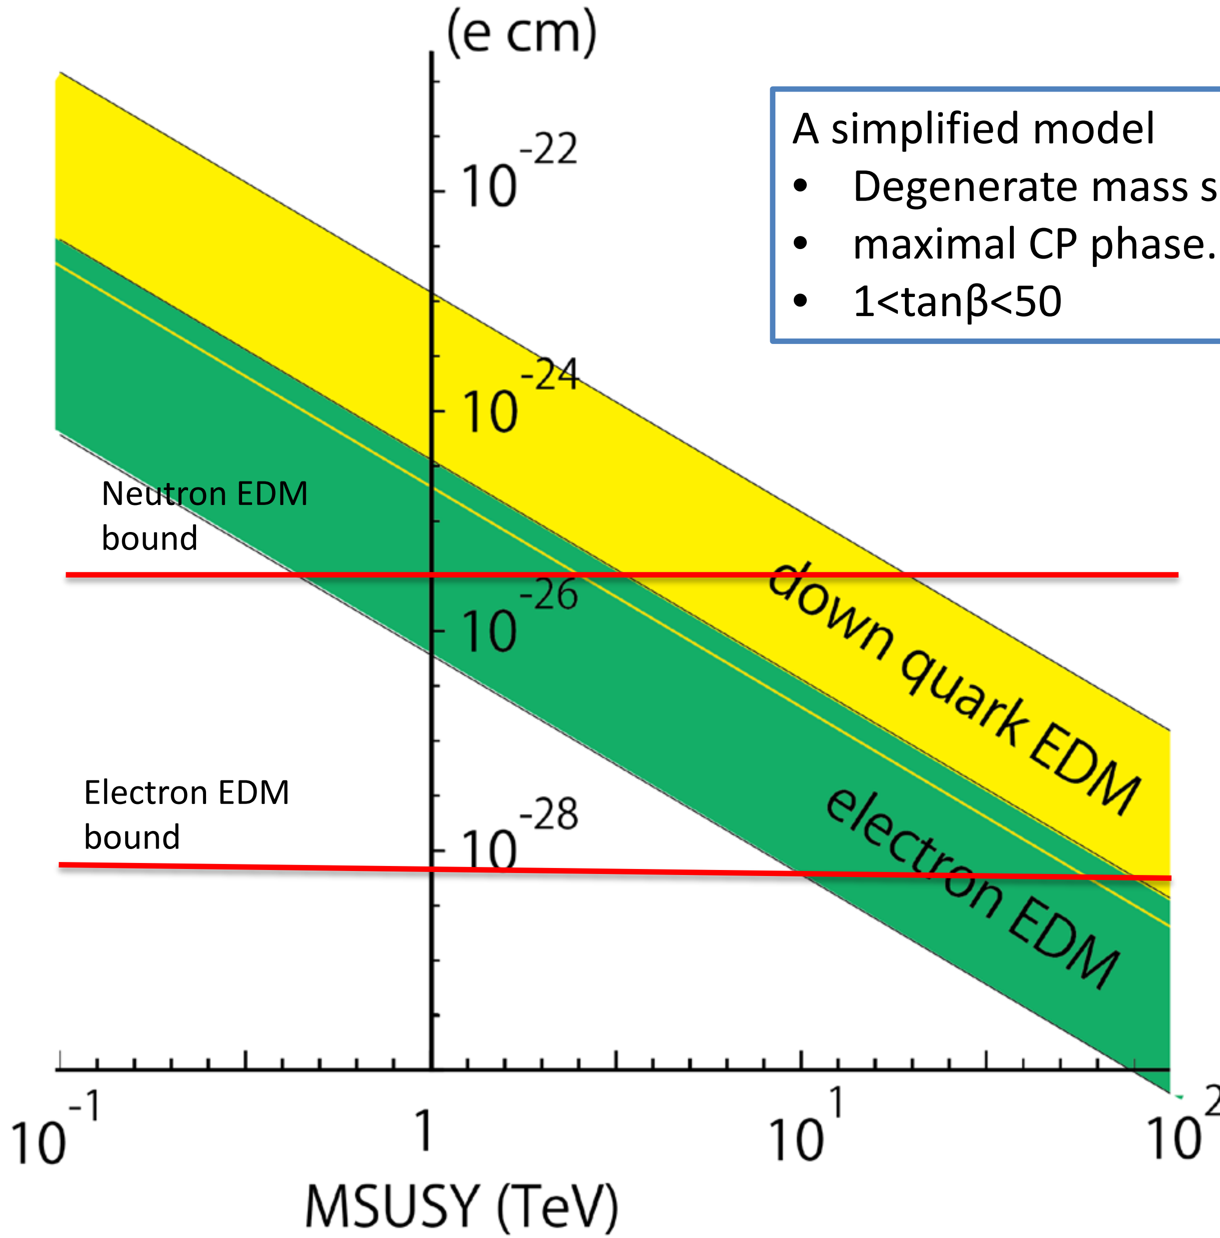
SUSY breaking terms have generically complex phases, which contribute to CP violation.

Following diagrams generate electorn EDM and quark (C)EDMs.





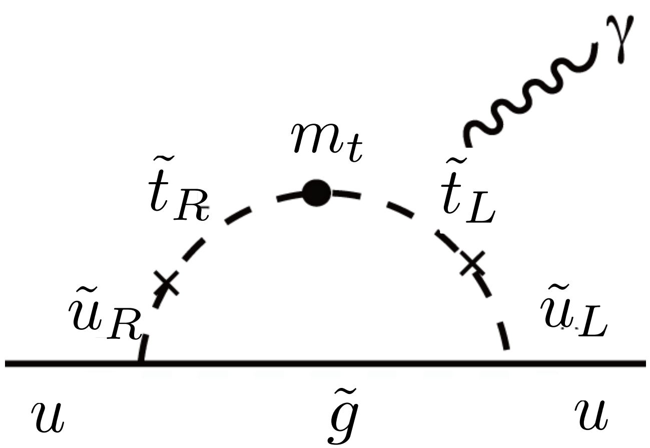
EDMs in Supersymmetric standard model

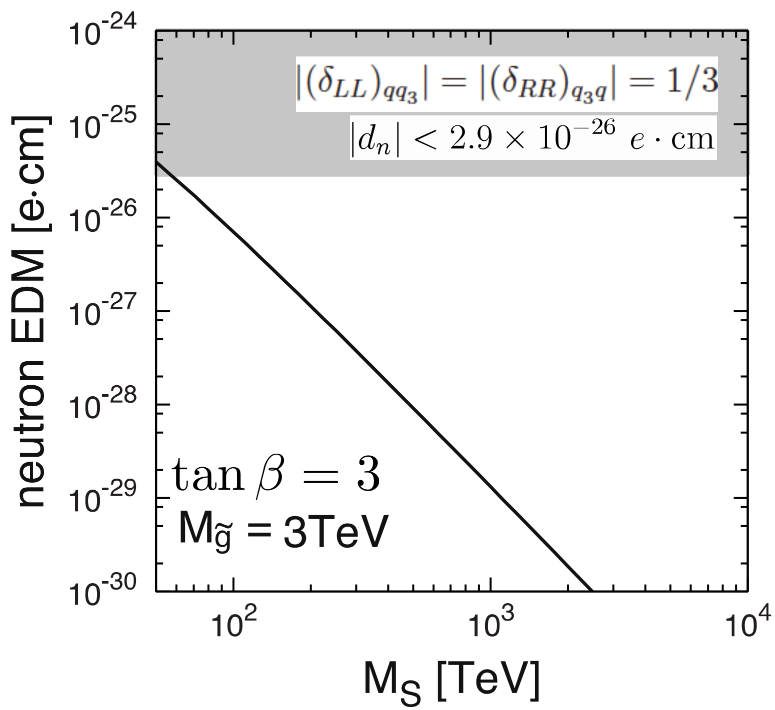


A simplified model
- Degenerate mass spectrum
- maximal CP phase.
- 1<tanβ<50

High-scale SUSY with generic flavor violation

In High-scale SUSY/miniSplit-SUSY model, sfermion masses are O(100)TeV while gaugino masses are around TeV. tanβ~1. Those suppresses EDMs. Even in the case, neutron EDM may be accessible to the model if generic flavor violation is assumed.





Similar recent works:

- McKeen, Pospelov, and Ritz
- Moroi and Nagai
- Altmannshofer, Harnik, Zupan
- …

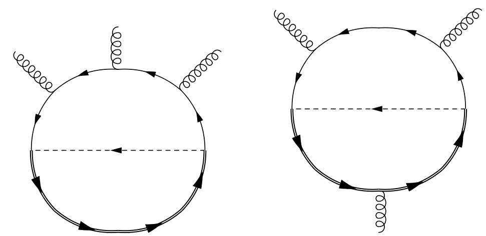
(Fuyuto, JH, Nagata, Tsumura. Anomalous dimension for CPV operators are evaluated in this paper.)

If new colored particle is discovered,

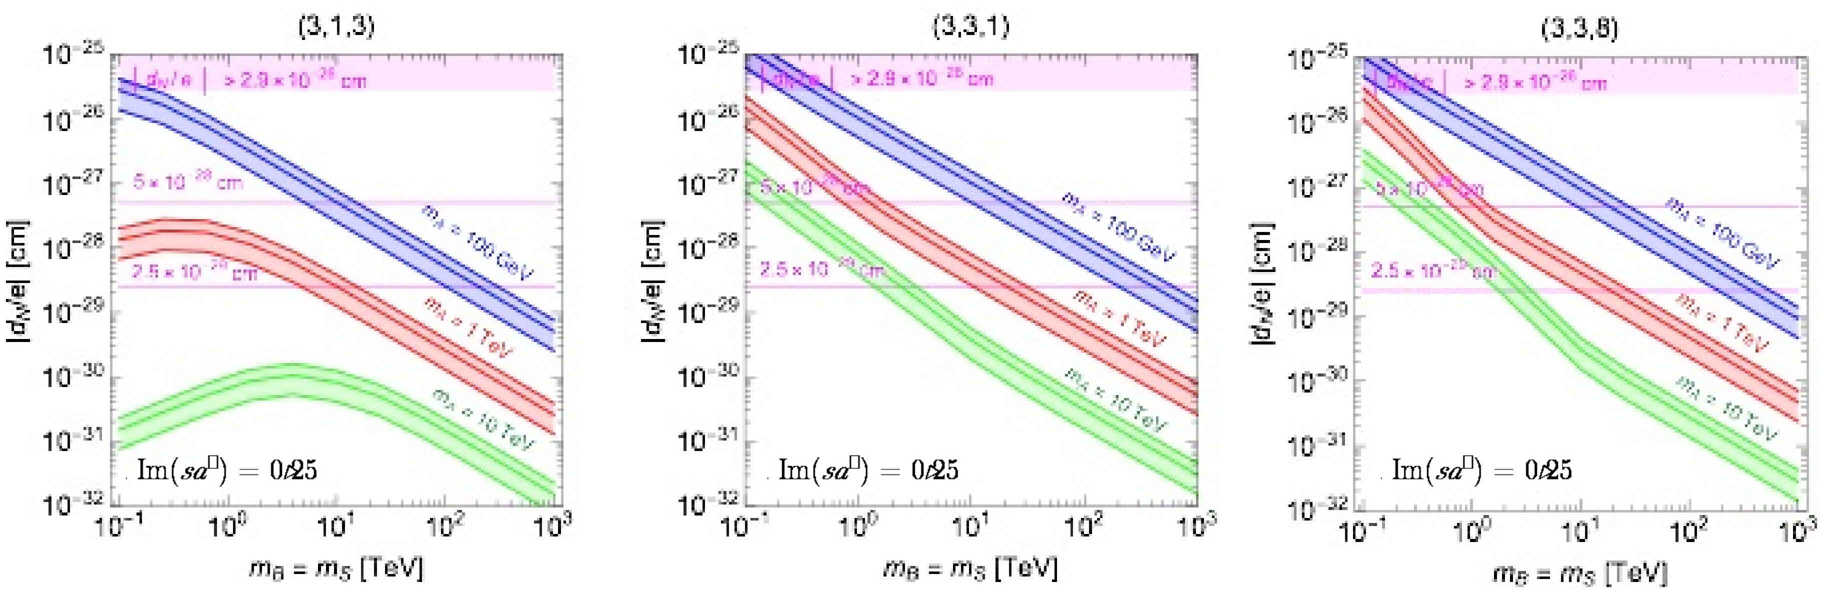
The general fermion-scalar interaction is

$$-\mathcal{L} = \bar{\psi}_B(s_{BAS} + a_{BAS}\gamma_5)\psi_A S + \text{h.c.}$$

And if $\text{Im}[s_{BAS}a^*_{BAS}] \neq 0$, CP is violating. Recently, we derive general formula for the Weinberg operator. (Abe, JH, Nagai, 1712.09503)



. . .



Higgs studies with EDMs

The discovered Higgs boson is the SM one ?

1, Higgs couplings to fermions and bosons are proportional to their masses?

2, Higgs boson is only one ?

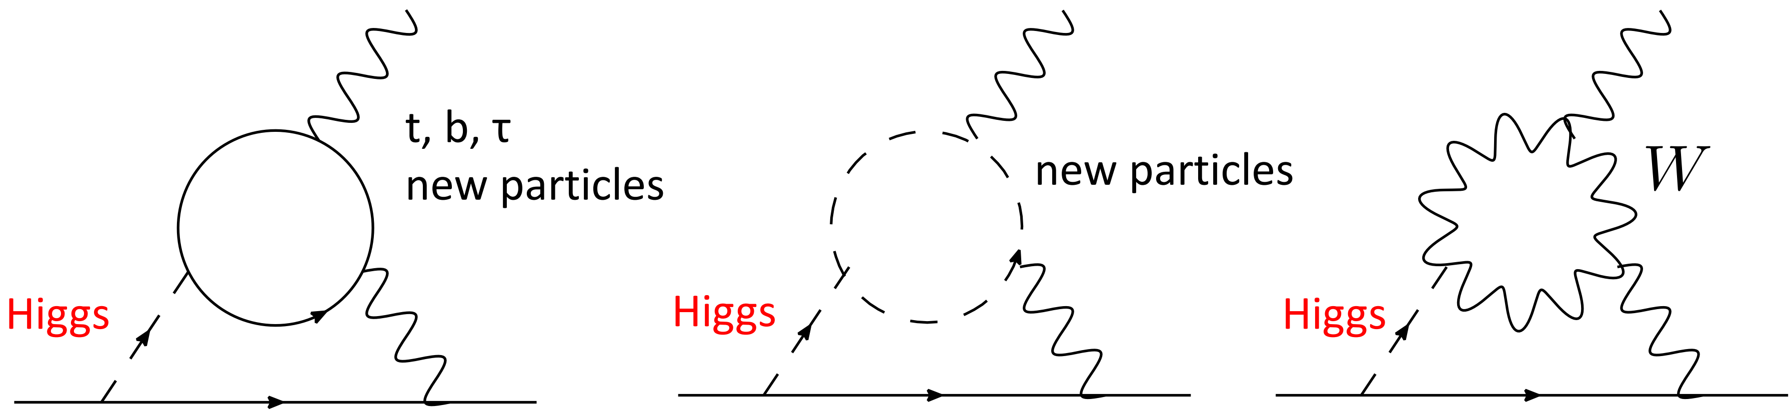
3, Higgs boson is CP even ?

4, Higgs boson interaction is flavor-conserving?

5, Higgs boson has new particles ?

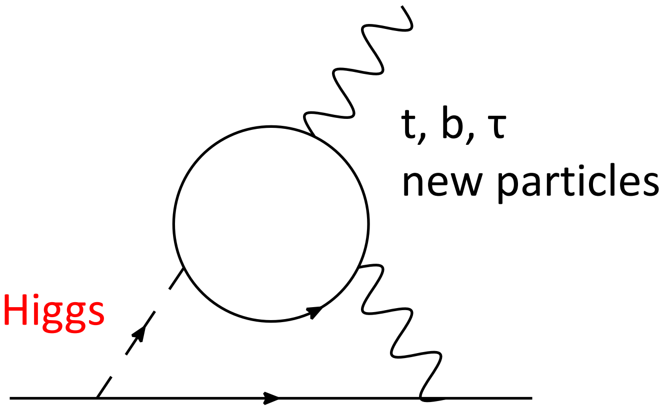
EDM measurements give hints for some of these questions.

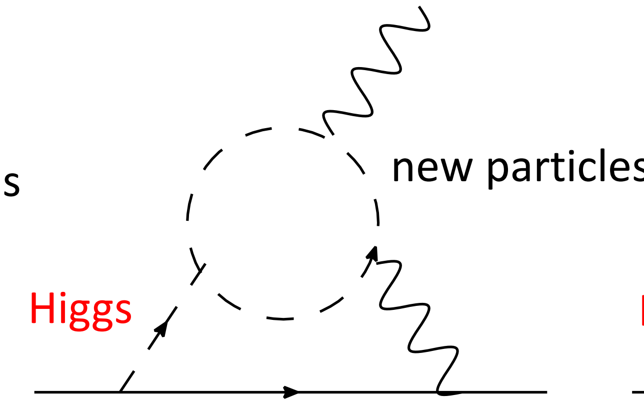
Higgs-mediated Barr-Zee diagrams

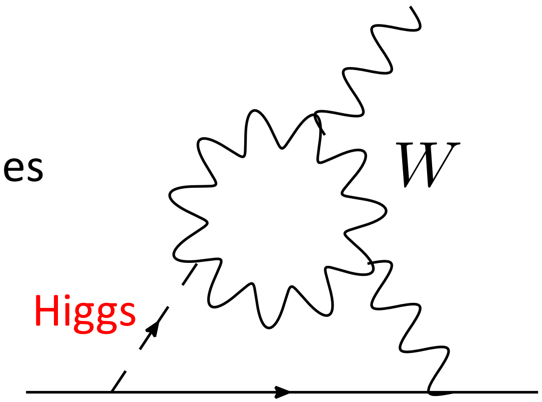


When Higgs boson has CP-violating coupling with SM particles or new particles in BSM, the Barr-Zee diagrams at two-loop level generate (C)EDMs for quarks and leptons.

Higgs-mediated Barr-Zee diagrams

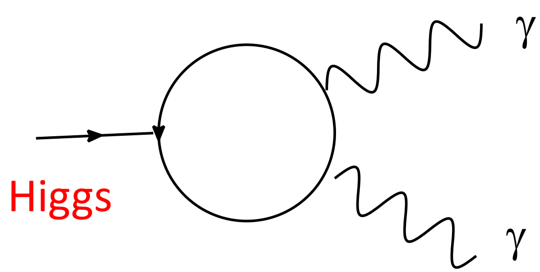






When Higgs boson has CP-violating coupling with SM particles or new particles in BSM, the Barr-Zee diagrams at two-loop level generate (C)EDMs for quarks and leptons.

New (charged) fermions coupled to (discovered) Higgs boson may contribute to both Higgs decay to 2 gammas and also EDMs.



New physics contribution to EDM and h→γγ

SU(2) mutiplet fermions (ψ), whose neutral component is the DM candidate, may have coupling with Higgs boson,

$$\mathcal{L}_H = -\frac{1}{2\Lambda}|H|^2\, \bar{\psi}^c(1+i\gamma_5 f)\psi + h.c..$$

(JH, Kobayashi, Mori, Senaha)

  Fan and Reece.
  McKeen, Pospelov and Ritz.
  …..

Two-Higgs doublet models

Two-Higgs doublet models have CP phase in the potential, and Barr-Zee diagrams generate (C)EDMs.

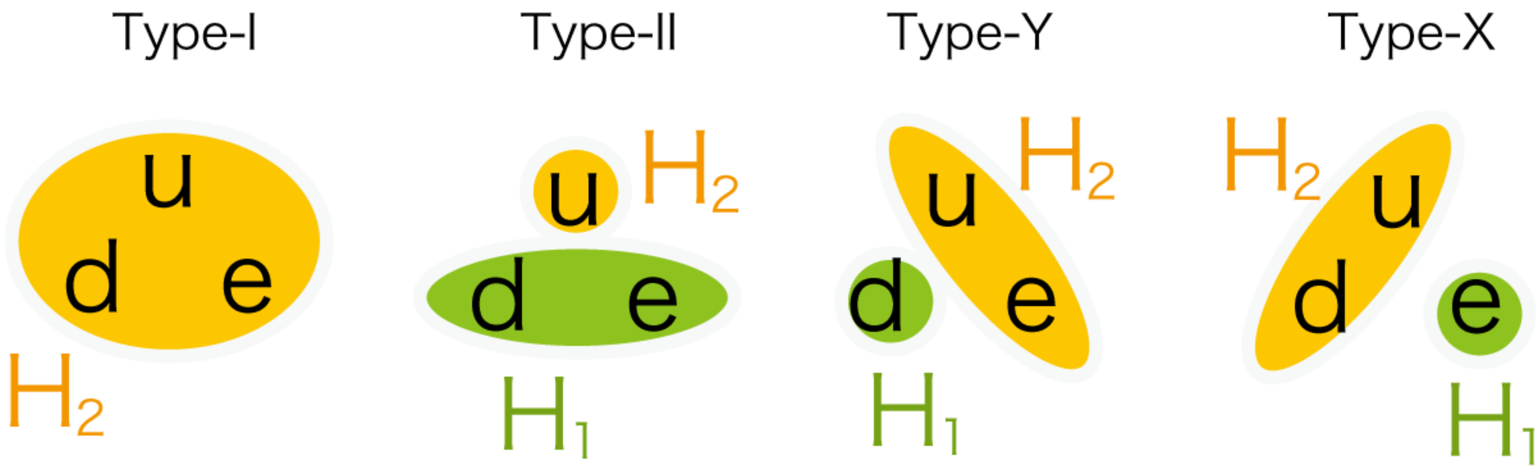
In Two-Higgs doublet models Z_2 symmetry is introduced to suppress FCNC processes.

Scalar potential in softly broken Z_2 symmetry has one CP phase.

$$
\begin{aligned}
V =& m_1^2 H_1^\dagger H_1 + m_2^2 H_2^\dagger H_2 - \left((\mathrm{Re} m_3^2 + i \mathrm{Im} m_3^2) H_1^\dagger H_2 + (h.c.) \right) \\
&+ \frac{1}{2}\lambda_1 (H_1^\dagger H_1)^2 + \frac{1}{2}\lambda_2 (H_2^\dagger H_2)^2 + \lambda_3 (H_1^\dagger H_1)(H_2^\dagger H_2) + \lambda_4 (H_1^\dagger H_2)(H_2^\dagger H_1) \\
&+ \left(\lambda_5 e^{i2\phi} (H_1^\dagger H_2)^2 + (h.c.) \right) .
\end{aligned}
$$

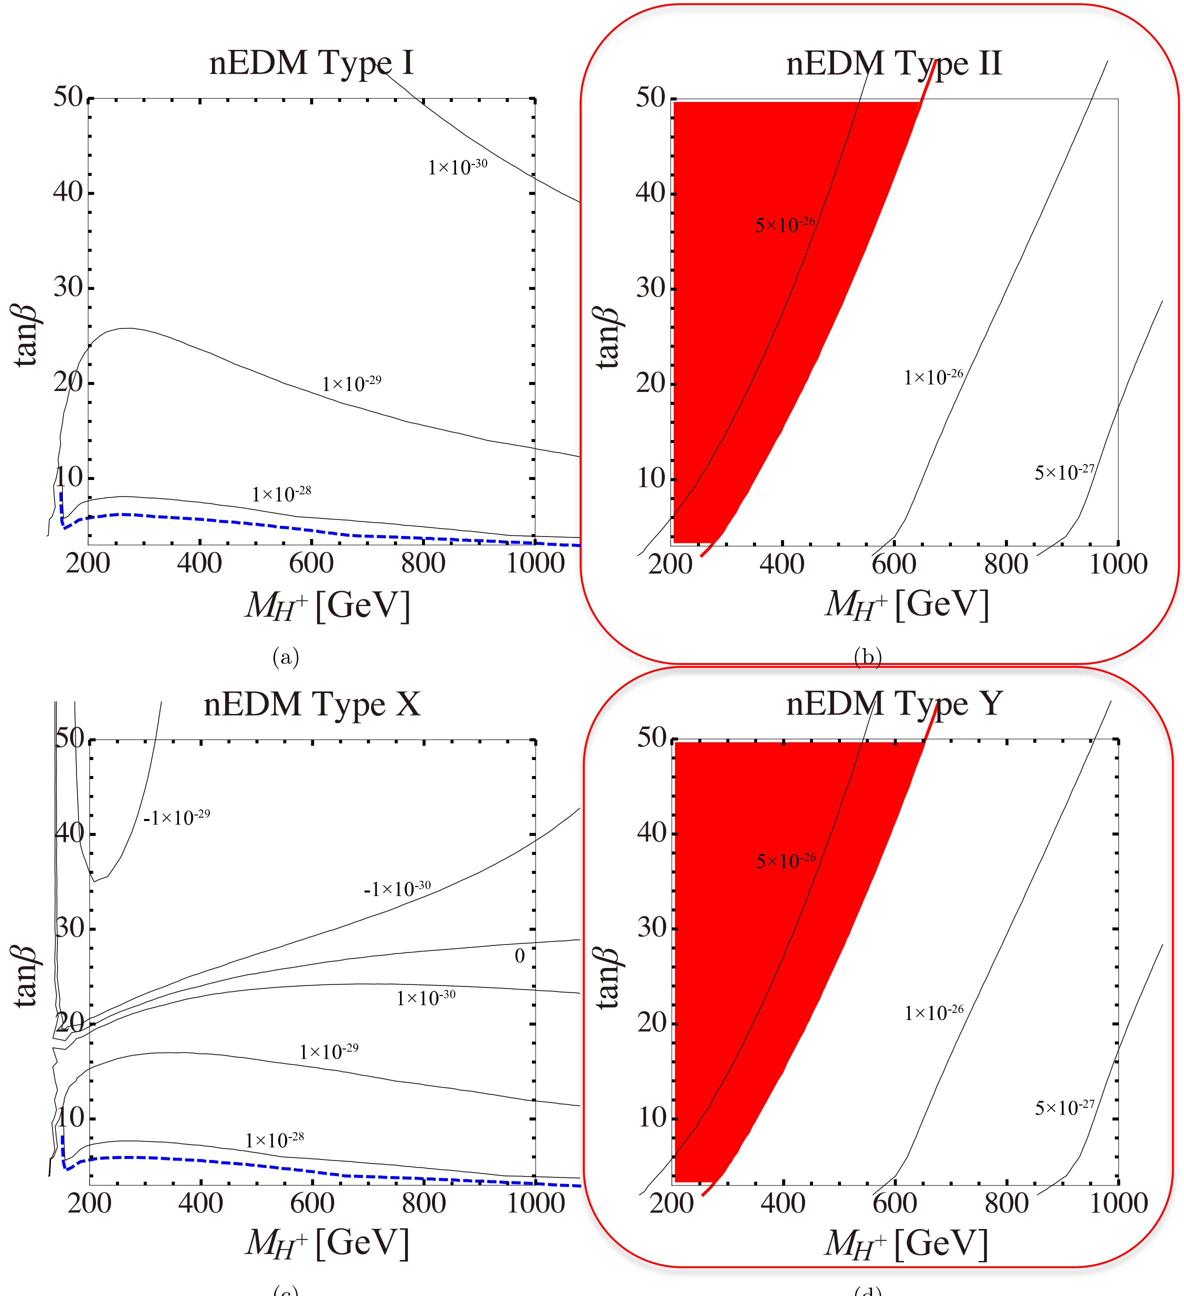
Two-Higgs doublet models

In Two-Higgs doublet models Z_2 symmetry is introduced to suppress FCNC processes. The 4 types of assignments are posiible



In typical cases, Yukawa coupling constants of H1 are larger than the SM ones, since $\langle H_2 \rangle >> \langle H_1 \rangle$ is expected. In the case, we may discriminate models with correlation among EDMs.

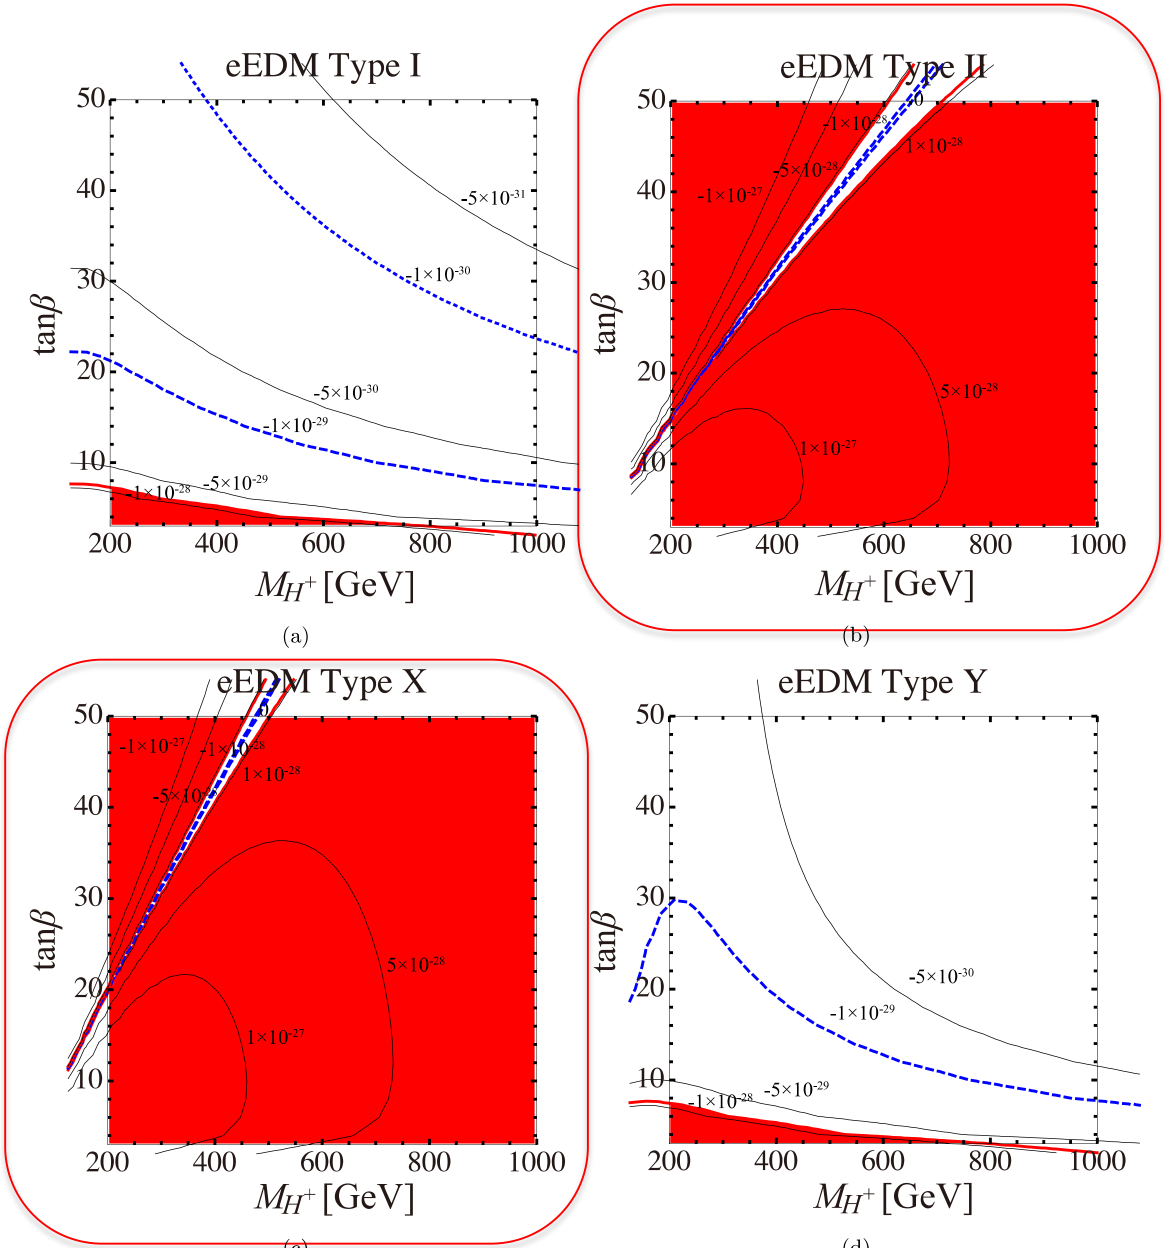
Neutron EDM in Two-Higgs doublet models



- Neutron EDM comes from CEDMs.
- For large tanβ, nEDM is suppressed in type I and X while it has the moderate dependence in type II and Y.
- Red region is excluded.

(Abe, JH, Kitahara, Tobioka)

Electron EDM in Two-Higgs doublet models



- For large tanβ, nEDM is suppressed in type I and Y while it has the moderate dependence in type II and X.
- Accidental cancellation appears in type II and X due to tau/bottom loops.
- Red region is excluded.

（Abe, JH, Kitahara, Tobioka)

Summary

- EDMs are sensitive to CP violation in new physics at and beyond TeV scale. The measurements are complimentary to the energy-frontier physics, such as LHC. Due to current null results in new physics searches at LHC, importance of the EDM measurements is increasing.
- Measurements of various particles are important to probe different CP violating terms.
- General formulae for Weinberg operator is derived. It is sensitive to new colored particles.
- Higgs boson properties can be constrained with EDMs induced by Barr-Zee two-loop diagrams.
- Evaluation of hadronic EDMs has large uncertainties, and more efforts are needed to reduce them.
